Abstract

This study empirically examines the effectiveness of yearly zakat distribution as an instrument for social welfare in the state of Selangor, Malaysia. The study applied the autoregressive distributed lag (ARDL) approach to examine these relationships over the period from 2010 to 2018. Overall, the study found that the zakat distribution contributes significantly to social welfare through education at a significance level of 5% and contributes inadequately through income level at 10% level of significance. This indicates that the current zakat distribution system in Selangor provides only a marginal influence on increasing the income of the poor. Furthermore, the zakat distribution was statistically insignificant to social welfare through healthcare. These findings suggest that the current distribution channels of health are insufficient to improve social welfare and should be improved by offering social health insurance policy for zakat beneficiaries. This can be done via ratification insurance plan between zakat agencies and insurance companies to cover the basic health needs for zakat recipients.
